I want to create a variable that is of type SuperClass. I am trying to create a method that can be used in an object oriented environment. A: The proper way to go about this is to do it this way: SuperClass sc = new SubClass(); Note that you don't need to know the name of the subclass, as it's only used for compilation purposes. This also works with interfaces, or any other subclass of the SuperClass. More in this answer. -- = \ 82157476af
